SEARCH REQUEST FORM

7.511

Requestor's Name: Name: Name: Serial Number: 09/047,652 Date: 7-2098 Phone: 305-5860 Art Unit: 1642
Search Topic: Please write a detailed statement of search topic. Describe specifically as possible the subject matter to be searched. Define any terms that may have a special meaning. Give examples or relevant citations, authors keywords, etc., if known. For sequences, please attach a copy of the sequence. You may include a copy of the broadest and/or most relevant claim(s).
Please seach SEQ ID 100:1-3
Plass: do an interference seanche of
Sog Ib No:1-3.
Return on paper print out.

Variance 5.497; scale 1.888 Mean 10.377; Statistics

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

Claim 1; Page 1068; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp. Couble-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

Earlosure; p; English.

Random point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which

Claim 3; Page 14; 23pp; English.
Oligonucleotide probe MK14-A consists of nucleotides 5-95 of Oligonucleotide probe MK14-A consists of nucleotides 5-95 of Oligonucleotide probe MK14-A consists of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Introducing random point mutations into nucleic acods -
Introducing random point mutations into nucleic acods -
Introducing random point mutations into nucleic acods -
Introducing random point mutation of molecules and screening.

Introducing random point mutation of molecules and screening.

Sinclosure; p; English.

Random point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a
single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules which terminate at all
possible nucleotide positions within a specified region. The
variable 3' ends generated in this way are used as primers for
reverse transcriptase and the molecules are misincorporated by the
transcriptase and the molecules are misincorporated by the
transcriptase and the molecules are misincorporated by the
cranscriptase and the molecules are substitutions, most of which
occurred singularly in any given mutant.

CTO0469 is a generic DNA sequence used to generate random TSAR peptide
This generic formula can be represented as follows: X(TGC)(NNB)10-
CTGC)(NNB)6Z(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction
sites (X is not the same as Y) that are not specified further. This
sequence generates peptides that are cloverleaf in structure. Other
concatenated by these generic sequences are shown in R65150-54. TSARs are
generated by these generic sequences are shown in R65150-54. TSARs are
concatenated heterofunctional proteins or peptides, comprising at least
two functional regions - a binding domain with affinity for a ligand and
a second effector peptide portion that is chemically or biologically
active. They may further comprise a linker peptide between the 2 domains.
The oligonucleotides are also designed so that the expressed peptide
contains 2 or 4 cysteine residues. These residues confer some degree of
conformational rigidity to the peptides. The TSARs or comprising
a TSAR binding domain can be used in vivo to deliver a chemically or
biologically active molety, eg. metal ion, radioisotope, peptide, toxin
or enzyme, to the specific target or on the cell. They can also replace
the function of macromolecules, eg. monoclonal or polyclonal antibodies
and therefore circumvent the need for complex methods of hybridoma
characterised and have designed activity allowing direct and rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ţ
                                                                                                                                                                                                                                                                                                                  n

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain blacing a binding domain and an effector domain blaciosure; Page 35; 255pp; English.

Q70468 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)6Z(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68. Other specified by these generic sequences are shown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       O70468 standard; DNA; 114 br.

Identifying proteins or peptide(s) which bind a ligand - by creening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain comprising a binding proteins. Solved to generate random TSAR (Totally CY0472 is a generic DNA sequence this generic formula can also be considered as follows: X(NNB)1(CAC)(NNB)(CAC)(NNB)2Z(NNB)6 considered as follows: X(NNB)1(CAC)(NNB)1(CAC)(NNB)2Z(NNB)6 considered as follows: X(NNB)1(CAC)(NNB)1(CAC)(NNB)2Z(NNB)6 considered as follows: X(NNB)1(CAC)(NNB)1(CAC)(NNB)2Z(NNB)6 considered by this and other generic sequences (Q70470-73) have invariant conscribing and other generic sequences (Q70470-73) have invariant conscribing a long domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active molety, eg. metal control of matternal comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal control cont
R65151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker comprise between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      have designed activity

Terson, Notice and Notice of the period of the processing fusion proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins or screening a recombinant vector library expressing fusion proteins or screening a recombinant vector library expressing fusion proteins.

Tomprising a binding domain and an effector domain proteins or page 35: 255pp; English.

Offorciosure; Page 35: 255pp; English.

Synthetic Affinity Reagents) peptides. This generate random TSAR (Totally Cynthetic Affinity Reagents) peptides. This generate formula can also be represented as follows: X(NNB)6(TGC)(NNB)11Z(NNB)14(TGC)(NNB)3Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Other specified further. Other generated by these general sequences are shown in Q70466-68.

Other specified further. Other generated by these general sequences are shown in Q70466-68.

Comprising at least two functional regions - a binding domain with a fill of the expressed peptide contains 2 or 4 cysteine residues positioned that the expressed peptide contains 2 or 4 cysteine residues positioned to rempse sequences are also designed so confer some degree of conformational rigidity to the peptides. The TSARS or compses. Comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, can also conformations the expressed peptide, tookin or enzyme, to the specific target or on the conformations of the peptide or on the period of the peptide of the peptide of the period of the period of the peptide of the conformation of marrowless or or on the conformation of the peptide of the period of the period of the peptide of t

Tidentifying proteins or peptide(s) which bind a ligand - by
screening a recombinant vector library expressing fusion proteins
occomprising a binding domain and an effector domain
bisclosure; Page 35; 255pp; English.

O70467 is a generic DNA sequence used to generate random TSAR (Totally
Synthetic Affinity Reagents) peptides. This generic formula can also be
conversented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)1Y. X
and Y are flanking restriction sites (X is not the same as Y) that are
not specified further. Other generic sequences are shown in Q70466-68.

Other specified further. Other generic sequences are shown in R5515-54. TSARs are concatenated by these generic sequences are shown in
R65151-54. TSARs are concatenated heterofunctional proteins or peptides,
comprising at least two functional regions - a binding domain with
affinity for a ligand and a second effector peptide portion that is
chemically or biologically active. They may further comprise a linker
peptide between the 2 domains. The oligonucleotides are also designed so
that the expressed peptide contains 2 or 4 cysteine residues positioned
in, or flanking, the unpredicted or variant residues. These residues
confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.
Confer some degree of conformational rigidity to the peptides.

Off0468 is a generic DNA Sequence used to generate random TSAR (Totally Off0468 is a generic DNA Sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NB)11(TGC)(NNB)5(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q7046-68.

Cother specified further of unctional regions - a binding domain with R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with R65151-54. TSARs are concatenated heterofunctional proteins or peptides for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The Oilgonucleotides are also designed so that the expressed peptide contains 2 or 4 cystelne residues positioned to finat the expressed peptide contains 2 or 4 cystelne residues positioned to finate some degree of conformational rigidity to the peptides. These residues confers some degree of conformational rigidity to the peptides. The readioisotope, peptide, toxin or enzyme, to the specific target or on the readioisotope, peptide, toxin or enzyme, to the specific target or on the conformation or polyclonal antibodies and therefore circumvent the need for conformation function of macromolecules, eg.

Cor compute methods of hybriddoma formation or in vivo antibody placet and rapid detection in a screening process.

refility for a ligand end e second effector peptide portion that is
comprised at least two functional regions - a binding demain with
compressed peptide contains 2 or 4 cysteine residues
confer some degree of conformational rigidity to the peptides. The TSARs
confer some degree of conformational rigidity to the peptides. The TSARs
confer some degree of conformational rigidity to the specific target or on the
coll. They can also replace the function of macromolecules, eg.
complex methods of hybridoma formation or in vivo antibody production.
The TSARs are easily characterised and have designed activity allowing
direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          e need for

Sequence 14, Application US/08232463
Sequence 14, Application US/08232463
Patent No. 5670367
GENERAL INFORMATION:
APPLICANT: DORNER, F.
APPLICANT: BORNER, F.
APPLICANT: FALKNER, F. G.
TITLE OF INVENTION: RECOMBINANT FOMLPOX VIRUS
NUMBER OF SEQUENCES: 52
CORRESPONDENCE ADDRESS:
ADDRESSE: Foley & Lardner
STREET: 1800 Diagonal Road, Suite 500
CITY: Alexandria
STATE: VA
COUNTRY: USA
COUNTRY: USA
ZIP: 22313-0299
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION NUMBER: US/08/232,463
FILING DATE:
CLASSIFICATION: 435
PRIOR APPLICATION NUMBER: US/07/935,313
